

# Shape Your Future Victoria

## Scenario Data Comparisons

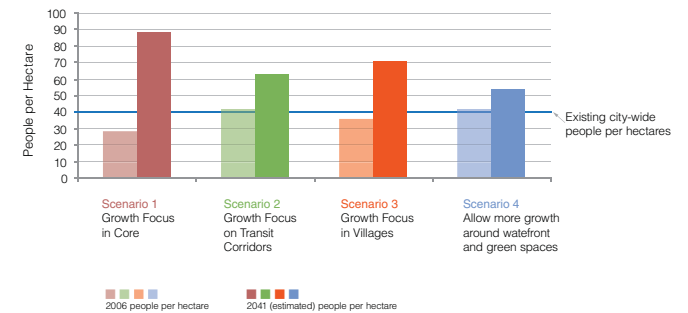

This graphic depicts the existing allocation of people in Victoria on a per-block basis, not building height. The height of each block indicates people per hectare located there.

Each of the Scenarios will result in an increase in people within the areas that they cover.

These images are a general depiction of the increase in the number of people per hectare within the growth areas that each scenario would result in.

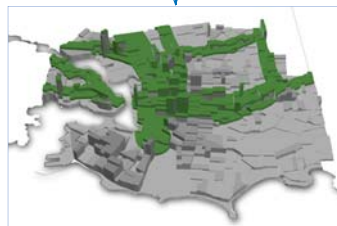

Changes in People per Hectare within the indicated Growth Areas

Scenarios 2041

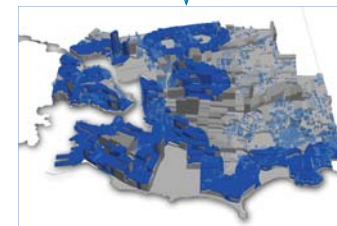

**Scenario 1** would accommodate most of Victoria's new population in the core, which currently has a low proportion of the City's population.

**Scenario 2** would accommodate most of Victoria's new population in a relatively large growth area along transit corridors.

**Scenario 3** would accommodate most of Victoria's new population in relatively compact growth areas in and around villages.

**Scenario 4** would create more opportunities for growth around waterfront and green spaces, as well as retain the remaining capacity that exists across the neighbourhoods. The area designated in the blue and green spaces is the largest of all the scenarios.
